

The Čebrať Tunnel

ABOUT THIS PROJECT:		
Market Segment: Tunnels	Investor: Národná diaľničná spoločnosť, a. s.	Products Used: Xypex Modified
Location: Ružomberok, Slovakia	General Contractor: Hydrostop s.r.o.	

The Čebrať Tunnel is an important part of Slovakia’s D1 motorway, the main transport route connecting the eastern and western regions of the country. Located near the town of Ružomberok, the tunnel stretches 2,026 meters. Xypex Modified was applied at the tunnel’s western portal to protect the reinforced concrete slope stabilizers and extend their service life. By increasing the concrete’s resistance to water penetration and aggressive chemicals, the application of Xypex Modified played a key role in ensuring the long-term durability and structural integrity of the slope stabilization system.
